# 1 INTRODUCTION

The Periodic Benefit-Risk Evaluation Report (PBRER) described in this guideline is intended to be a common standard for periodic benefit-risk evaluation reporting on marketed products (including approved drugs that are under further study) among the ICH regions. Regulators from EU, Japan, and the US believe that the PBRER may be used to meet prevailing national and regional requirements for periodic safety and/or benefit-risk reports for approved medicinal products.

This guideline defines the recommended content and format of a PBRER and provides an outline of points to be considered in its preparation and submission.

Definitions of many technical terms used in the guideline are included in a glossary (Appendix A); the first mention of a term in the guideline is identified with an asterisk (\*).

## 1.1 Background

When a new medicinal product is approved for marketing, demonstration of safety and efficacy are generally based on data from a limited number of patients, many studied under the controlled conditions of randomised trials. Often, higher risk subgroups and patients with concomitant illnesses that require use of other drugs are excluded from clinical trials, and long-term treatment data are limited. Moreover, patients in trials are closely monitored for evidence of adverse events. In clinical practice, monitoring is less intensive, a broader range of patients are treated (age, co-morbidities, drugs, genetic abnormalities), and events too rare to occur in clinical trials may be observed (e.g., severe liver injury). These factors underlie the need for continuing analysis of relevant safety, efficacy,<sup>1</sup> and effectiveness<sup>1</sup> information throughout the lifecycle of a medicinal product – promptly, as important findings occur – and periodically, to allow an overall assessment of the accumulating data.

Although the majority of new information will be safety-related, new information about effectiveness, limitations of use, alternative treatments, and many other aspects of the drug's place in therapy may be pertinent to its benefit-risk assessment.

The ICH Guideline E2C, Clinical Safety Data Management: Periodic Safety Update Reports for Marketed Drugs, achieved Step 4 in 1996, and was intended to harmonise the periodic reporting requirements to regulatory authorities and to provide, in a common format, the worldwide safety experience of a medicinal product at defined times post-approval. At that time, the focus of the Periodic Safety Update Report (PSUR) was on relevant new safety information in the context of patient exposure, to determine if changes were needed to the product information in order to optimise the use of the product. The guideline was revised in 2003, to provide needed clarification, as well as to provide additional guidance and flexibility.

The pharmacovigilance environment has evolved, however, prompting reassessment of the role of the PSUR in the spectrum of safety documents submitted to regulatory authorities. This reassessment highlighted several factors that led to consensus for revision and refocus of the guideline, to enhance its usefulness in light of advances in the field:

---

<sup>1</sup> The terms efficacy and effectiveness are not standardised, and have different meanings in some regions.

- 112 • significant progress in the technology and science of pharmacovigilance, including  
113 electronic submission of individual case safety reports (ICSRs) to regulatory  
114 authorities, automated data mining techniques, and more attention to benefit-risk  
115 evaluation;
- 116 • greater emphasis on proactive and documented risk management planning;
- 117 • increasing recognition that meaningful evaluation of important new risk  
118 information should be undertaken in the context of a medicinal product's benefits;  
119 and
- 120 • overlap in the content of ICH guidelines related to pharmacovigilance  
121 documentation, particularly between ICH guideline E2C, the safety specification  
122 component of ICH guideline E2E, and ICH guideline E2F, the Development  
123 Safety Update Report (DSUR).

124 As noted above, the primary objective of the PSUR was to provide a comprehensive  
125 picture of the safety of approved medicinal products. With recognition that the  
126 assessment of the risk of a medicinal product is most meaningful when considered in  
127 light of its benefits, the proposed report would provide greater emphasis on benefit  
128 than the PSUR, particularly when risk estimates change importantly. In such cases  
129 there will need to be an overall explicit evaluation of benefit-risk. Consequently the  
130 name of the proposed report is the "Periodic Benefit-Risk Evaluation Report"  
131 (PBRER). The PBRER would also provide greater emphasis on the cumulative  
132 knowledge regarding a medicinal product, while retaining a focus on new  
133 information.

134 A formal evaluation of benefit is a new feature of the PBRER; however, it is  
135 recognised that a concise discussion of benefit will usually be sufficient, unless the  
136 safety or benefit-risk profile has changed significantly during the reporting interval.  
137 Thus, the level of detail provided in certain sections of the PBRER (e.g., evaluation  
138 of safety and efficacy data, evaluation of safety signals,\* and benefit-risk evaluation)  
139 should be proportional to the medicinal product's known or emerging important risks  
140 and to evidence of emerging important benefits.

141 The frequency of submission of reports to regulatory authorities is subject to national  
142 or regional regulatory requirements, and may differ, depending on a number of  
143 factors. The guideline includes specific advice on managing different frequencies of  
144 PBRER submission in different regions.

145 The PBRER has been developed in such a way that the content of particular sections  
146 of the report could be identical to that of corresponding sections of other regulatory  
147 documents, specifically the safety specification described in the ICH guideline E2E  
148 and the DSUR described in ICH guideline E2F. Thus, the content of these sections  
149 of the PBRER is envisioned to be suitable for use in the other reports. This "modular  
150 approach\*\*" would allow sections or modules to be submitted at different times to  
151 multiple authorities, across separate documents (i.e., the PBRER, DSUR, and safety  
152 specification). Only modules that include new information would need to be updated  
153 when submitting the PBRER. This approach is expected to improve efficiency for  
154 marketing authorisation holders (MAHs) and regulatory authorities in their preparation  
155 and review of these documents, respectively.

## 1.2 Objectives

The main objective of a PBRER is to present a comprehensive and critical analysis of new or emerging information on the risks of the medicinal product, and, where pertinent, on its benefit in approved indications, to enable an appraisal of the product's overall benefit-risk profile. The PBRER should be submitted to regulatory authorities, and will contain an evaluation of new information relevant to the medicinal product that became available to the MAH during the reporting interval, in the context of cumulative information by:

- examining whether the information obtained by the MAH during the reporting interval is in accord with previous knowledge of the medicinal product's benefit and risk profile;
- summarising relevant new safety information that could have an impact on the benefit-risk profile of the medicinal product;
- summarising any important new efficacy/effectiveness information that has become available during the reporting interval; and
- where important new safety information has emerged, conducting an integrated benefit-risk evaluation for approved indications.

When desired by the MAH, a list of the sources of information used to prepare the PBRER can be provided as an appendix to the report.<sup>2</sup>

A PBRER should be concise and provide sufficient information to assure regulatory authorities that the MAH is adequately monitoring and evaluating the evolving risk profile of a medicinal product. All pertinent new safety information discovered during the reporting interval<sup>3</sup> should be discussed in the appropriate sections of the PBRER. Urgent safety information should be reported through the appropriate mechanism; the report is not intended to be used to provide initial notification of significant new safety information or to provide the means by which new safety concerns\* are detected.

## 1.3 Scope of the PBRER

The main focus of each PBRER is the evaluation of relevant new safety information from the available data sources,<sup>3</sup> placed within the context of any pertinent efficacy/effectiveness information that may have become available since the International Birth Date (IBD), the date of the first marketing approval in any country in the world, or the Development International Birth Date (DIBD), the date of first authorisation for the conduct of an interventional clinical trial in any country.<sup>4</sup> The PBRER should include cumulative knowledge of the product while retaining focus on new information, i.e., the overall safety evaluation and integrated benefit-risk evaluation will take into account cumulative information. Because clinical development of a drug frequently continues following marketing approval, relevant

---

<sup>2</sup> Examples of potential sources of information to be used in preparation of a PBRER will be included in the Step 4 guideline as general guidance.

<sup>3</sup> This guideline should not serve to limit the scope of information to be provided in the evaluation of benefit-risk of a medicinal product. Please refer to the applicable laws and regulations in the countries and regions in which the PBRER is to be submitted.

<sup>4</sup> For the purpose of this document, the terms "authorisation" and "authorised" refer to clinical trials and the terms "approval" and "approved" refer to marketing applications.

193 information from post-marketing studies or clinical trials in unapproved indications or  
194 populations should also be included in the PBRER. Similarly, as knowledge of the  
195 safety of a medicinal product may be derived from evaluation of data associated with  
196 uses other than the approved indication(s), such knowledge would be reflected in the  
197 risk evaluation, where relevant and appropriate.

198 The PBRER should provide summaries of significant safety, efficacy/effectiveness  
199 information from data sources available to the MAH, when relevant to the benefit-risk  
200 evaluation.

#### 201 **1.4 Relation of the PBRER to Other ICH Documents**

202 At present, some ICH countries and regions accept submission of separate types of  
203 periodic reports to fulfil national and regional requirements within the post-approval  
204 period: the PSUR (ICH guideline E2C(R1)) for periodic reporting of the safety of  
205 approved medicinal products, the DSUR (ICH guideline E2F) for periodic reporting  
206 on the safety of medicinal products that remain in clinical development, and the  
207 safety specification component of ICH guideline E2E that might be submitted at the  
208 time of marketing application and/or PSUR submission to aid in the planning of  
209 pharmacovigilance activities. As these documents have different regulatory  
210 purposes, different periodicities, and can be reviewed by different divisions within a  
211 single regulatory authority, each document needs to be complete in its own right – a  
212 comprehensive document that can stand alone. Nevertheless, overlap and repetition  
213 between the content of the DSUR, PSUR, and safety specification can lead to  
214 inefficiencies – both in the production of the documents by the MAH, and in the  
215 review of the documents by regulatory authorities. This guideline aims to address  
216 this duplication and facilitate flexibility by encouraging the use of individual modules,  
217 where they pertain to more than one report – to be used at different times, for  
218 different authorities, and for different purposes. Therefore, the PBRER has been  
219 developed in such a way that content of several sections may be used for sections of  
220 other documents as a basis for a modular approach (see Section 1.1).

## 221 **2 GENERAL PRINCIPLES**

### 222 **2.1 Single PBRER for an Active Substance**

223 The PBRER should provide information on all approved indications, dosage forms,  
224 and regimens for the active substance, with a single data lock point. In some  
225 circumstances, it will be appropriate to present data by indication, dosage form,  
226 dosing regimen, or population (e.g., children vs. adults) within the relevant section(s)  
227 of the PBRER. In exceptional cases, submission of separate PBRERs might be  
228 appropriate, for example, an active substance used in two formulations for systemic  
229 and topical administration in entirely different indications. In these cases, the  
230 regulatory authorities should be notified and their agreement obtained, preferably at  
231 the time of approval.

### 232 **2.2 PBRERs for Fixed Dose Combination Product**

233 For combinations of substances also marketed individually, information for the fixed  
234 combination may be reported either in a separate PBRER or included as separate  
235 presentations in the report for one of the individual substances, depending on the  
236 circumstances. Cross-referencing all relevant PBRERs is considered important.

## 237 **2.3 Products Manufactured and/or Marketed by More than One Company**

238 Each MAH is responsible for submitting PBRERs for its own products.

239 When companies are involved in contractual relationships (e.g., licensor-licensee),  
240 respective responsibilities for preparation and submission of the PBRER to the  
241 regulatory authorities should be clearly specified in the written agreement.

242 When data received from a partner company(ies) might contribute meaningfully to the  
243 safety and/or benefit-risk analyses and influence the reporting company's product  
244 information, these data should be included and discussed in the PBRER.

## 245 **2.4 Reference Information**

246 An objective of a PBRER is to evaluate whether information obtained during the  
247 reporting interval is in accord with previous knowledge on the product's benefit and  
248 risk, and to indicate whether changes should be made to product information.  
249 Reference information is needed to perform this comparison. Having one reference  
250 source of information in common for the three ICH regions would facilitate a practical,  
251 efficient, and consistent approach to the safety evaluation and make the PBRER a  
252 unique report accepted in all countries and regions.

253 It is a common practice for MAHs to prepare their own "Company Core Data Sheet,"  
254 CCDS, which covers material relating to safety, indications, dosing, pharmacology,  
255 and other information concerning the medicinal product. The core safety information  
256 contained within the CCDS is referred to as the "Company Core Safety Information,"  
257 CCSI. The latest CCDS in effect at the end of the reporting interval should be used  
258 as the reference for both the benefit and risk sections of the PBRER. The national or  
259 regional approved product information, which can differ from the CCDS, continues to  
260 be the reference document upon which labeledness/expectedness is based for the  
261 purpose of national or regional expedited post-marketing safety reporting.

262 It is important to highlight any differences between the CCSI and the national or  
263 regional product information/labelling in the cover letter or a regional appendix  
264 accompanying submission of the PBRER.

265 The MAH should continuously evaluate whether any revision of CCDS/CCSI is  
266 needed whenever new safety information is obtained throughout the reporting interval.  
267 All changes to the CCDS/CCSI made during the interval should be described in  
268 Section 4 ("Changes to Reference Safety Information\*") and/or Section 16 ("Signal  
269 and Risk Evaluation") of the PBRER. The MAH should provide a copy of the current  
270 version of the CCDS(s) referred to in the PBRER as an appendix to the report.

## 271 **2.5 Level of Detail within PBRER**

272 The level of detail provided in certain sections of the PBRER should depend on the  
273 medicinal product's known or emerging important benefits and risks. This approach  
274 is applicable to those sections of the PBRER in which there is evaluation of safety  
275 data, efficacy/effectiveness data, safety signals, and benefit-risk. Therefore, the  
276 extent of information provided in such PBRER sections will vary among individual  
277 PBRERs.

278 For example, when there is important new safety information, a detailed presentation  
279 of that information should be included, plus any other relevant contextual information  
280 (e.g., updated full benefit information) needed to facilitate a robust benefit-risk  
281 analysis. Conversely, when little new important safety information has become

282 available during the reporting interval, a concise summary of baseline benefit  
283 information should be sufficient, and the benefit-risk evaluation would consist  
284 primarily of an evaluation of updated interval safety data, with the recognition that the  
285 benefit-risk profile has not changed during the reporting interval.

## 286 **2.6 Benefit-Risk Evaluation**

287 When a drug is approved for marketing, a conclusion has been reached that, when  
288 used in accordance with approved product information, its benefits outweigh its risks.  
289 As new information about the drug emerges during marketing experience, benefit-risk  
290 evaluation should be carried out to determine whether benefits continue to outweigh  
291 risks, and to consider whether steps need to be taken to improve the benefit-risk  
292 relationship through risk minimisation activities,\* e.g., labelling changes,  
293 communications with prescribers, or other steps.

294 This assessment may include evaluation of populations and/or endpoints that were  
295 not investigated in the registrational clinical trials.

## 296 **2.7 Periodicity and PBRER Data Lock Point**

### 297 **2.7.1 International Birth Date and Data Lock Point**

298 The date of the first marketing approval for the medicinal product in any country in  
299 the world is the IBD. For medicinal products that are on the market in many countries,  
300 it is possible that there are several national or regional birthdates. Such different  
301 birthdates should be harmonised with the IBD with agreement of regulatory  
302 authorities. Through PBRERs prepared with harmonised IBDs, the same updated  
303 safety and benefit-risk information can be reviewed globally by all regulatory  
304 authorities.

305 The data lock point is the date designated as the cut-off for data to be included in a  
306 PBRER, based on the IBD. For administrative convenience, if desired by the MAH,  
307 the data lock point of the PBRER can be designated as the last day of the month of  
308 the end of the reporting interval, with a corresponding change to the start date of the  
309 next reporting interval. When a report contains information on different dosage forms,  
310 formulations, or uses (indications, routes and/or populations), which might be  
311 approved at different times, the original IBD should be maintained to determine the  
312 data lock point for purposes of the unified PBRER.

313 When clinical development of a medicinal product continues following marketing  
314 approval, the starting point of the DSUR reporting interval can be synchronized with  
315 the IBD-based cycle, so that both the DSUR and PBRER can be prepared at the  
316 same time.

### 317 **2.7.2 Managing Different Frequencies of PBRER Submission**

318 The need for the submission of a PBRER and the frequency of report submission to  
319 regulatory authorities are subject to national or regional regulatory requirements, and  
320 usually depend on such factors as the length of time the product has been on the  
321 market and the extent of knowledge of the benefit-risk profile of the product. During  
322 the initial years of marketing of new molecular entities (NMEs), reports will generally  
323 be requested more frequently (i.e., 6-monthly or annually). Once a drug has been  
324 marketed for several years, national or regional regulation may allow the frequency of  
325 submission to be extended to longer time intervals; however, more frequent PBRERs  
326 may continue to be required in other regions. As a result, the following

327 circumstances give some indication of the various scenarios that may be  
 328 encountered by MAHs:

- 329 • Because approval dates and/or reporting frequency requirements differ across  
 330 regions, PBRERs may be required on 6-monthly, annual, and less frequent  
 331 submission timetables simultaneously across many regions.
- 332 • In some countries or regions, for products considered to have an established and  
 333 acceptable safety profile or considered to be low risk, the frequency of reporting  
 334 may be reduced, or the need to submit periodic reports may be eliminated  
 335 completely. Even in such cases, where PBRERs are no longer required to be  
 336 submitted, it is expected that MAH's will continue to evaluate the safety of their  
 337 products on a regular basis and report any new safety information that impacts on  
 338 the benefit-risk profile or the labelling of the product.
- 339 • Changes in reporting frequency may also apply after important additions or  
 340 changes in clinical use are approved (e.g., new indication[s] and/or new  
 341 population[s]), if such changes are regarded as having the potential to impact the  
 342 benefit-risk profile of the product. In these circumstances, it is possible that the  
 343 reporting interval will be shortened, even for older products with a previously  
 344 reduced frequency of PBRER submission.
- 345 • An ad hoc PBRER may be requested by a regulatory authority (see Section  
 346 2.7.3.2 of this guideline)

347 As a result, the MAH may need to prepare PBRERs covering different intervals for  
 348 different regulatory authorities.

349 It is anticipated that the “modular approach” introduced in this guideline will facilitate  
 350 management of different frequencies of PBRER submission, and enhance the  
 351 consistency and quality of the PBRER (see Section 1.1).

352 Independent of the length of the interval covered by the report:

- 353 • To the extent permitted under national or regional regulatory requirements,  
 354 regulatory authorities may accept periodic reports based on the IBD of the product,  
 355 using the content and format described in this guideline. Use of a single  
 356 harmonised IBD for each product is important in order to reduce the burden of  
 357 work involved in preparing PBRERs, and respects the original purpose of the  
 358 PBRER – to prepare a single worldwide summary on a product that can be  
 359 submitted to regulatory authorities.
- 360 • For newly approved products, a 6-monthly periodicity applies in many regions, for  
 361 at least the first 2 years after an NME is approved.
- 362 • For PBRERs submitted on a routine/regular basis, the reports should be based on  
 363 cumulative data, with interval data sets of 6 months, or multiples thereof.
- 364 • Whereas sections that provide interval information are likely to need to be  
 365 updated, the content used in the previous PBRER module can be reviewed and  
 366 reused for sections where no new information has arisen since preparation of the  
 367 last PBRER, if appropriate. Specifically, sections that provide evaluation of  
 368 cumulative data may not need to be updated (see Section 2.7.3.2, Figure 1;  
 369 Appendix D).

### 370 **2.7.3 PBRERs When Periodicity Differs Across Regions**

371 When the MAH needs to prepare PBRERs covering different intervals for different  
372 regulatory authorities, the following approach should be used, and will eliminate the  
373 need for Summary Bridging Reports and Addendum Reports. Summary Bridging  
374 Reports and Addendum Reports, introduced in ICH guideline E2C(R1), should no  
375 longer be submitted.

376 Each PBRER should be a stand-alone document; the format and table of contents of  
377 all reports should be as described in this guideline. Regardless of the duration of the  
378 interval covered, each report should include interval data for the period covered, as  
379 well as cumulative data.

#### 380 **2.7.3.1 PBRERs with Data Lock Points Based on the International Birth Date**

381 For two or more PBRERs that have the same data lock point but cover different  
382 durations, the cumulative sections of the PBRERs will be the same, whereas the  
383 interval sections may differ (see Section 2.7.3.2, Figure 1).

384 The cumulative data sections from the most recent PBRER can be submitted, along  
385 with updated interval data in the following sections, as appropriate:

- 386 • Actions Taken in the Reporting Interval for Safety Reasons (3.3)
- 387 • Changes to Reference Safety Information (3.4)
- 388 • Summaries of Significant Safety Findings from Clinical Trials during the Reporting  
389 Period (3.7)
- 390 • Findings from Non-interventional Studies\* (3.8)
- 391 • Information from Other Clinical Trials and Sources (3.9)
- 392 • Non-clinical data (3.10)
- 393 • Literature (3.11)
- 394 • Other Periodic Reports (3.12)
- 395 • Lack of Efficacy in Controlled Clinical Trials (3.13)
- 396 • Late-Breaking Information (3.14)

397 For signal evaluation, MAHs should review the relevant sections from individual  
398 PBRERs covering the reporting interval, and incorporate the most recent information  
399 for each signal newly identified,\* ongoing,\* or closed\* during that reporting interval.

400 For newly identified information on risk and efficacy/effectiveness, the MAH should  
401 review the relevant sections from individual PBRERs covering the reporting interval,  
402 and incorporate into the PBRER any new information that contributes to the overall  
403 benefit-risk evaluation that had not already been included in the CCDS at the  
404 beginning of the reporting interval.

405 The cumulative benefit, risk, and integrated benefit-risk evaluation sections of the  
406 most recently prepared PBRER should be reviewed and updated, if necessary.

#### 407 **2.7.3.2 Ad hoc (“for cause”) PBRERs**

408 Ad hoc (“for cause”) PBRERs, i.e., reports outside the specified reporting  
409 requirements, are required by some regulatory authorities, generally when there are

new risks, when risks have changed, when efficacy/effectiveness has changed, or when there are changes to the benefit-risk profile of a medicinal product (see Section 3.17.1). Ad hoc PBRERs are not typically used to address urgent concerns. For all ad hoc PBRERs, it will be necessary for the regulatory authority to specify the duration of interval data.

It is likely that the appropriate data and evaluation sections will need to be updated, and focus on particular concerns raised in the ad hoc request. The overall benefit-risk evaluation and conclusion sections from the most recently submitted PBRER will need to be carefully reviewed and may require revision (Scenario D in Figure 1).

Where an ad hoc report is requested and a PBRER has not been prepared for a number of years, it is likely that a completely new report will need to be prepared by the MAH.

Where an ad hoc PBRER has been requested by one regulatory authority (e.g., in response to a new safety or benefit-risk concern), the MAH should consider communicating the findings at the same time to the regulatory authorities in other countries where the product is approved. Other regulatory authorities may request copies of the ad hoc PBRER, if desired.

**Figure 1. Submission of PBRERs Based on the Same Data Lock Point, with Various Reporting Periods.**

Shading indicates period of interval data.

For all reports, the cumulative data reflect all data from the IBD/DIBD.

\* update the most recent cumulative and interval data, as appropriate

#### 2.7.4 Time Interval between Data Lock Point and the Submission

As a result of the expanded scope of the PBRER, the time interval between the data lock point and submission of PBRERs should be as follows:

- PBRERs covering intervals of 6 or 12 months: within 70 calendar days
- PBRERs covering intervals in excess of 12 months: within 90 calendar days

- 437 • Ad hoc PBRERs: 90 calendar days, unless otherwise specified in the ad hoc  
438 request.

439 Where national or regional requirements differ from the above, the MAH should  
440 discuss the timeline for submission with the relevant regulatory authority.

## 441 **2.8 Format and Presentation of PBRER**

### 442 **2.8.1 Format**

443 The recommended format and content of the PBRER, including table of contents,  
444 section numbering, and content of each section, is outlined below.

445 The full ICH guideline E2C(R2) format should be used for all PBRERs. When no  
446 relevant information is available or a PBRER section is not applicable, this should be  
447 stated. In some countries and regions, the PBRER requirement may be linked to  
448 other regulatory documents for pre-approval periodic reporting (i.e., DSUR), post-  
449 marketing pharmacovigilance planning and/or risk management. The regulatory  
450 authorities and MAHs can take advantage of the modular approach of the PBRER  
451 (i.e., sections that can be separated and submitted independently or combined with  
452 other documents) to facilitate such regulatory needs, maximize the utility of the  
453 content, and reduce duplicate work.

### 454 **2.8.2 Presentation**

455 The recommended table of contents, including section numbering, for the PBRER is  
456 provided below:

457	Title Page
458	Executive Summary
459	Table of Contents
460	1. Introduction
461	2. Worldwide Marketing Approval Status
462	3. Actions Taken in the Reporting Interval for Safety Reasons
463	4. Changes to Reference Safety Information
464	5. Estimated Exposure and Use Patterns
465	5.1 Cumulative Subject Exposure in Clinical Trials
466	5.2 Cumulative and Interval Patient Exposure from Marketing Experience
467	6. Data in Summary Tabulations
468	6.1 Reference Information
469	6.2 Cumulative Summary Tabulations of Serious Adverse Events from
470	Clinical Trials
471	6.3 Cumulative and Interval Summary Tabulations from Post-marketing
472	Data Sources
473	7. Summaries of Significant Findings from Clinical Trials during the Reporting
474	Period
475	7.1 Completed Clinical Trials

476	7.2	Ongoing Clinical Trials
477	7.3	Long-term Follow-up
478	7.4	Other Therapeutic Use of Medicinal Product
479	7.5	New Safety Data Related to Fixed Combination Therapies
480	8.	Findings from Non-interventional Studies
481	9.	Information from Other Clinical Trials and Sources
482	10.	Non-clinical Data
483	11.	Literature
484	12	Other Periodic Reports
485	13	Lack of Efficacy in Controlled Clinical Trials
486	14	Late-Breaking Information
487	15	Overview of Signals: New, Ongoing, or Closed
488	16	Signal and Risk Evaluation
489	16.1	Summary of Safety Concerns
490	16.2	Signal Evaluation
491	16.3	Evaluation of Risks and New Information
492	16.4	Characterisation of Risks
493	16.5	Effectiveness of Risk Minimisation (if applicable)
494	17	Benefit Evaluation
495	17.1	Important Baseline Efficacy/Effectiveness Information
496	17.2	Newly Identified information on Efficacy/Effectiveness
497	17.3	Characterisation of Benefits
498	18	Integrated Benefit-risk Analysis for Approved Indications
499	18.1	Benefit-risk Context - Medical Need and Important Alternatives
500	18.2	Benefit-risk Analysis Evaluation
501	19	Conclusions and Actions
502	20	Appendices

### 503 **3 GUIDANCE ON CONTENTS OF THE PBRER**

504 All sections should be completed; when no information is available, this should be  
505 stated. Note that section 3.X of this guideline provides information on preparation of  
506 Section X of the PBRER, i.e., "Reference Information," described in Section 3.6.1 of  
507 this guideline, refers to Section 6.1 of the PBRER.

#### 508 **Title Page**

509 The title page of the PBRER should include the following information:

- 510 • date of the report;

- 511 • medicinal product(s);
- 512 • International Birth Date;
- 513 • reporting interval;
- 514 • MAH(s) name(s) and address(es); and
- 515 • statement on the confidentiality of the information included in the PBRER.

## 516 **Executive Summary**

517 This section should provide a concise summary of the most important information  
518 contained in the report.

519 The following information should be included in the Executive Summary:

- 520 • introduction;
- 521 • reporting interval;
- 522 • medicinal product(s) – mode(s) of action, therapeutic class(es), indication(s),  
523 dose(s), route(s) of administration, formulation(s);
- 524 • estimated cumulative exposure of clinical trial subjects; interval and cumulative  
525 post-approval exposure;
- 526 • number of countries in which the medicinal product is approved;
- 527 • summary of overall benefit-risk evaluation (based on Section 18.2 of the  
528 PBRER);
- 529 • actions taken or proposed for safety reasons, e.g., significant changes to the  
530 labelling, other risk minimisation activities;
- 531 • conclusions.

## 532 **Table of Contents**

### 533 **3.1 Introduction**

534 Section 1 of the PBRER should include:

- 535 • international birth date;
- 536 • reporting interval;
- 537 • medicinal product(s) – mode(s) of action, therapeutic class(es), dose(s), route(s)  
538 of administration, formulation(s);
- 539 • a brief description of the approved indication(s) and population(s)
- 540 • a brief description and explanation of any information that has not been included  
541 in the PBRER; and
- 542 • the rationale for submission of multiple PBRERs for the medicinal product, if  
543 applicable.

### 544 **3.2 Worldwide Marketing Approval Status**

545 Section 2 of the PBRER should provide a brief narrative overview including date of  
546 first approval, indication(s), approved dose(s), and where approved, if applicable.

### 547 3.3 Actions Taken in the Reporting Interval for Safety Reasons

548 Section 3 of the PBRER should include a description of significant actions related to  
549 safety that have been taken during the reporting interval, related to either  
550 investigational uses or marketing experience, by the MAH, sponsor of a clinical  
551 trial(s), regulatory authorities, data monitoring committees, or ethics committees that  
552 had:

- 553 • a significant influence on the benefit-risk profile of the approved medicinal  
554 product, and/or
- 555 • an impact on the conduct of a specific clinical trial(s) or on the overall clinical  
556 development programme.

557 The reason(s) for each action should be provided, if known, and additional relevant  
558 information should be provided when appropriate. Relevant updates to previous  
559 actions should also be summarised in this section. Examples of significant actions  
560 taken for safety reasons include:

#### 561 Actions related to investigational drugs:\*

- 562 • refusal to authorise a clinical trial for ethical or safety reasons;
- 563 • partial<sup>5</sup> or complete clinical trial suspension or early termination of an ongoing  
564 clinical trial\* because of safety findings or lack of efficacy;
- 565 • recall of investigational drug or comparator;
- 566 • failure to obtain marketing approval for a tested indication, including voluntary  
567 withdrawal of a marketing application;
- 568 • risk management activities, including:
  - 569 ○ protocol modifications due to safety or efficacy concerns (e.g., dosage  
570 changes, changes in study inclusion/exclusion criteria, intensification of subject  
571 monitoring, limitation in trial duration);
  - 572 ○ restrictions in study population or indications;
  - 573 ○ changes to the informed consent document relating to safety concerns;
  - 574 ○ formulation changes;
  - 575 ○ addition by regulators of a special safety-related reporting requirement;
  - 576 ○ issuance of a communication to investigators or healthcare professionals; and
  - 577 ○ plans for new studies to address safety concerns.

#### 578 Actions related to marketed drugs:

- 579 • failure to obtain a marketing approval renewal;
- 580 • withdrawal or suspension of a marketing approval;
- 581 • risk management activities including:

---

<sup>5</sup> "Partial suspension" might include several actions (e.g., suspension of repeat dose studies, but continuation of single dose studies; suspension of trials in one indication, but continuation in another, and/or suspension of a particular dosing regimen in a trial but continuation of other doses).

- 582 ○ Significant restrictions on distribution or introduction of other risk minimisation
- 583 measures;
- 584 ○ significant safety-related changes in labelling documents that could affect the
- 585 development programme, including restrictions on use or population treated;
- 586 ○ communications to health care professionals; and
- 587 ○ new post-marketing study requirement(s) imposed by regulators.

### 588 **3.4 Changes to Reference Safety Information**

589 Section 4 of the PBRER should list any significant changes to the reference safety  
 590 information within the reporting interval. Such changes might include information  
 591 relating to contraindications, warnings, precautions, serious adverse drug reactions  
 592 (ADRs), adverse events of special interest, and interactions; important findings from  
 593 ongoing and completed clinical trials;\* and significant non-clinical findings (e.g.,  
 594 carcinogenicity studies). Specific information relevant to these changes should be  
 595 provided in the appropriate sections of the PBRER. A tracked changes version of the  
 596 reference document should be included (as an attachment) that identifies changes  
 597 over the reporting interval.

598 The MAH should also provide, in a regional appendix, information on any final,  
 599 ongoing, or proposed changes to the national or local authorised product information  
 600 based on the most recent version of the CCSI.

### 601 **3.5 Estimated Exposure and Use Patterns**

602 Sections 5.1 and 5.2 of the PBRER should provide estimates of the size and nature  
 603 of the population exposed to the medicinal product. Section 5.1 of the PBRER  
 604 should provide information on cumulative exposure in clinical trials. Section 5.2  
 605 should provide cumulative and interval exposure in the marketed setting. Brief  
 606 descriptions of the method(s) used to estimate the subject/patient exposure should  
 607 be described, as well as the limitations thereof. Consistent methods for calculating  
 608 patient exposure should be used across PBRERs for the same product. If a change  
 609 in the method is appropriate, both methods and calculations should be provided in  
 610 the PBRER introducing the change.

#### 611 **3.5.1 Cumulative Subject Exposure in Clinical Trials**

612 Section 5.1 of the PBRER should include the following information, if applicable,  
 613 presented in tabular format (see Appendix B, Tables 1-3 for examples):

- 614 • Cumulative numbers of subjects from ongoing and completed clinical trials
- 615 exposed to the investigational medicinal product, placebo, and/or active
- 616 comparator(s) since the DIBD. It is recognised that for older products, detailed
- 617 data might not be available.
- 618 • More detailed cumulative subject exposure in clinical trials should be presented if
- 619 available, e.g., sub-grouped by age, sex, and racial group for the entire
- 620 development programme.
- 621 • Important differences among trials in dose, routes of administration, or patient
- 622 populations can be noted in the tables, if applicable, or separate tables can be
- 623 considered.

- 624 • If clinical trials have been or are being performed in special populations (e.g.,  
625 pregnant women; patients with renal, hepatic, or cardiac impairment; or patients  
626 with relevant genetic polymorphisms), exposure data should be provided, as  
627 appropriate.
- 628 • When there are substantial differences in time of exposure between subjects  
629 randomised to the investigational medicinal product or comparator(s), or  
630 disparities in length of exposure between clinical trials, it can be useful to express  
631 exposure in subject-time (subject-days, -months, or -years).
- 632 • Investigational drug exposure in healthy volunteers might be less relevant to the  
633 overall safety profile, depending on the type of adverse reaction, particularly when  
634 subjects are exposed to a single dose. Such data can be presented separately  
635 with an explanation as appropriate.
- 636 • If the serious adverse events (SAEs) from clinical trials are presented by  
637 indication in the summary tabulations, the patient exposure should also be  
638 presented by indication, where available.
- 639 • For individual trials of particular importance, demographic characteristics should  
640 be provided separately.

### 641 **3.5.2 Cumulative and Interval Patient Exposure from Marketing Experience**

642 When possible, separate estimations should be provided for cumulative exposure  
643 (since the IBD) and interval exposure (since the data lock point of the previous  
644 PBRER), see Appendix B, Tables 4-5 for examples. Although the difficulty of  
645 obtaining and validating exposure data is recognised, the estimated number of  
646 patients exposed should be provided when possible, along with the method(s) used  
647 to determine the estimate. A justification should be provided if an estimate of the  
648 number of patients exposed is impossible to obtain. If an estimate of the number of  
649 patients is not available, alternative estimated measures of exposure, if available,  
650 should be presented along with the method(s) used to derive them. Examples of  
651 alternative measures of exposure include patient-days of exposure and number of  
652 prescriptions. Only if such measures are not available, measures of drug sales, such  
653 as tonnage or dosage units, may be used. The concept of a defined daily dose may  
654 also be used to arrive at patient exposure estimates.

655 The data should be presented according to the following categories:

#### 656 1. Post-approval (non-clinical trial) exposure:

657 An overall estimation of patient exposure should be provided.

658 In addition, the data should be routinely presented by indication, sex, age, dose,  
659 formulation, and region, where applicable.

660 Depending upon the product, other variables may be relevant, such as number of  
661 vaccination courses, route(s) of administration, and duration of treatment.

662 When there are patterns of reports indicating a safety signal, exposure data within  
663 relevant subgroups should be presented, if possible.

#### 664 2. Post-approval use in special populations

665 Where post-approval use has occurred in special populations, available information  
666 regarding cumulative patient numbers exposed and the method of calculation should

667 be provided. Sources of such data would include non-interventional studies designed  
668 to obtain this information, including registries. Populations to be considered for  
669 discussion include, but might not be limited to:

- 670 • paediatric population;
- 671 • elderly population;
- 672 • pregnant or lactating women;
- 673 • patients with hepatic and/or renal impairment;
- 674 • patients with other relevant co-morbidity;
- 675 • patients with disease severity different from that studied in clinical trials;
- 676 • sub-populations carrying relevant genetic polymorphism(s);
- 677 • patients of different racial and/or ethnic origins.

### 678 3. Patterns of Use of the Medicinal Product

679 If the MAH becomes aware of patterns of use of the medicinal product considered  
680 relevant for the interpretation of safety data, provide a brief description thereof. Such  
681 patterns may include, in particular, off-label use (e.g., an anti-epileptic drug used off-  
682 label for neuropathic pain and/or prophylaxis of migraine headaches). If known, the  
683 MAH may briefly comment on whether such off-label use is supported by clinical  
684 guidelines, clinical trial evidence, or an absence of approved alternative treatments.  
685 Quantitative use information should be provided, if available. For purposes of  
686 identifying which patterns of use are off-label, the MAH should reference the CCDS in  
687 the PBRER.

### 688 3.6 Data in Summary Tabulations

689 Sections 6.1-6.3 of the PBRER should present cumulative summary tabulations of  
690 SAEs from clinical trials and post-marketing sources that have been reported to the  
691 MAH since the DIBD. At the discretion of the MAH, graphical displays can be used to  
692 illustrate specific aspects of the data when useful to enhance understanding.

#### 693 3.6.1 Reference Information

694 Section 6.1 of the PBRER should specify the version(s) of the coding dictionary used  
695 for analyses of adverse reactions.

#### 696 3.6.2 Cumulative Summary Tabulations of Serious Adverse Events from 697 Clinical Trials

698 Section 6.2 of the PBRER should provide background for the appendix that provides  
699 a cumulative summary tabulation of SAEs reported in the MAH's clinical trials, from  
700 the DIBD to the data lock point of the current PBRER. The MAH should explain any  
701 omission of data (e.g., clinical trial data might not be available for products marketed  
702 for many years). The tabulation(s) should be organised by system organ class  
703 (SOC), for the investigational drug, as well as for the comparator arm(s) (active  
704 comparators, placebo) used in the clinical development programme. Data can be  
705 integrated across the programme. Alternatively, when useful and feasible,  
706 tabulations of SAEs can be presented by trial, indication, route of administration, or

707 other variables. This section should not serve to provide analyses or conclusions  
708 based on the SAEs.

709 Appendix B, Table 6 of this guideline provides an example of summary tabulations of  
710 serious adverse events from clinical trials. The following points should be  
711 considered:

- 712 • In general, the tabulation(s) of SAEs from clinical trials should include only those  
713 terms that were used in defining the case as serious; they should not include non-  
714 serious events.
- 715 • When the Medical Dictionary for Regulatory Activities (MedDRA) terminology is  
716 used for coding the adverse event/reaction terms, the Preferred Term level and  
717 SOC should be presented in the summary tabulations.
- 718 • The tabulations should include blinded and unblinded clinical trial data. Unblinded  
719 serious adverse events might originate from completed trials and individual cases  
720 that have been unblinded for safety-related reasons (e.g., expedited reporting), if  
721 applicable. Sponsors/MAHs should not unblind data for the specific purpose of  
722 preparing the PBRER.
- 723 • Certain adverse events in clinical trials can be excluded from the clinical trials  
724 summary tabulations, but such exclusions should be explained in the report. For  
725 example, adverse events that have been defined in the protocol as “exempt” from  
726 special collection and entry into the safety database because they are anticipated  
727 in the patient population, and those that represent study endpoints, can be  
728 excluded (e.g., deaths reported in a trial of a drug for congestive heart failure  
729 where all-cause mortality is the primary efficacy endpoint, disease progression in  
730 cancer trials).
- 731 • Causality assessment is generally useful for the evaluation of individual rare  
732 ADRs. Individual case causality assessment has less value in the analysis of  
733 aggregate data, where group comparisons of rates are possible. Therefore, the  
734 summary tabulations should include all SAEs for the investigational drug, active  
735 controls, and placebo. It may be useful to give rates by dose.

### 736 **3.6.3 Cumulative and Interval Summary Tabulations from Post-marketing Data** 737 **Sources**

738 Section 6.3 of the PBRER should provide background for the appendix that provides  
739 cumulative and interval summary tabulations of adverse reactions, from the IBD to  
740 the data lock point of the current PBRER. These adverse reactions are derived from  
741 non-interventional studies and spontaneous ICSRs, including reports from healthcare  
742 professionals, consumers, scientific literature, regulatory authorities. Serious and  
743 non-serious reactions should be presented in a single table, with interval and  
744 cumulative data presented side-by-side (see Appendix B, Table 7). The table should  
745 be organised by SOC. For special issues or concerns, additional tabulations of  
746 adverse reactions can be presented by indication, route of administration, or other  
747 variables. This section should not serve to provide analyses or conclusions based on  
748 the data presented. As described in ICH guideline E2D, for marketed medicinal  
749 products, spontaneously reported\* adverse events usually imply at least a suspicion  
750 of causality by the reporter, and should be considered to be adverse reactions for  
751 regulatory reporting purposes.

752 **3.7 Summaries of Significant Safety Findings from Clinical Trials during the**  
753 **Reporting Period**

754 A listing of any MAH-sponsored interventional trials with the primary aim of  
755 identifying, characterising, or quantifying a safety hazard, confirming the safety profile  
756 of the medicinal product, or measuring the effectiveness of risk management  
757 measures that were completed or ongoing during the reporting interval (i.e., post-  
758 authorisation safety studies, PASS\*), should be included in an appendix.

759 When possible and relevant, data categorized by sex and age (particularly children  
760 versus adult), indication, dose, and region should be presented.

761 The signals arising from clinical trial sources should be tabulated in Section 15 of the  
762 PBRER. For those that are considered to be either a potential\* or identified risk,\* the  
763 risk should be evaluated and characterised in Sections 16.3 and 16.4, respectively.

764 **3.7.1 Completed Clinical Trials**

765 Section 7.1 of the PBRER should provide a brief summary of clinically important  
766 emerging efficacy and safety findings obtained from clinical trials completed during  
767 the reporting interval. This information can be presented in narrative format or as a  
768 synopsis. It could include information that supports or refutes previously identified  
769 safety concerns, as well as evidence of new safety signals.

770 **3.7.2 Ongoing Clinical Trials**

771 If the MAH is aware of clinically important information that has arisen from ongoing  
772 clinical trials (e.g., learned through interim safety analyses or as a result of unblinding  
773 of subjects with adverse events), this section should briefly summarise the  
774 concern(s). It could include information that supports or refutes previously identified  
775 safety concerns, as well as evidence of new safety signals.

776 **3.7.3 Long-term Follow-up**

777 Where applicable, this section should provide information from long-term follow-up of  
778 subjects from clinical trials of investigational drugs, particularly advanced therapy  
779 products.

780 **3.7.4 Other Therapeutic Use of Medicinal Product**

781 This section of the PBRER should include clinically important safety information from  
782 other programmes conducted by the MAH that follow a specific protocol, with  
783 solicited reporting as per ICH guideline E2D (e.g., expanded access programmes,  
784 compassionate use programmes, particular patient use, single-patient investigational  
785 new drug applications (INDs), treatment INDs, and other organised data collection).

786 **3.7.5 New Safety Data Related to Fixed Combination Therapies**

787 Unless otherwise specified by national or regional regulatory requirements, the  
788 following options can be used to present data from combination therapies.

- 789 • If the product that is the subject of a PBRER is also approved or under  
790 development as a component of a fixed combination product or a multi-drug  
791 regimen, this section should summarise important safety findings from use of the  
792 combination therapy.

- 793 • If this PBRER is for a fixed combination product, this section should summarise  
794 important safety information arising from the individual components whether  
795 approved or under development.

796 The information specific to the combination can be incorporated into a separate  
797 section(s) of the PBRER for one or all of the individual components of the  
798 combination.

### 799 **3.8 Findings from Non-interventional Studies**

800 This section should summarise relevant safety information or information with  
801 potential impact on the benefit or risk evaluations, from MAH-sponsored non-  
802 interventional studies that became available during the reporting interval (e.g.,  
803 observational studies, epidemiological studies, registries, and active surveillance  
804 programmes). This should include relevant information from drug utilisation studies  
805 when applicable to multiple regions.

806 A listing of any MAH-sponsored non-interventional study(s) with the primary aim of  
807 identifying, characterising, or quantifying a safety hazard, confirming the safety profile  
808 of the medicinal product, or measuring the effectiveness of risk management  
809 measures that were completed or ongoing during the reporting interval (i.e., post-  
810 authorisation safety studies), should be included in an appendix. Progress or final  
811 study reports generated during the reporting period for post-authorisation safety  
812 studies (PASS) should also be included as a regional appendix to the report.

### 813 **3.9 Information from Other Clinical Trials and Sources**

814 This section should summarise information relevant to the risk evaluation of the  
815 medicinal product from any other clinical trial/study sources that is accessible by the  
816 MAH with reasonable and appropriate effort, and became available to the MAH  
817 during the reporting interval (e.g., results from pooled analyses or meta-analyses of  
818 randomised clinical trials, safety information provided by co-development partners or  
819 from investigator-initiated trials).

### 820 **3.10 Non-clinical Data**

821 This section should summarise major safety findings from non-clinical *in vivo* and *in*  
822 *vitro* studies (e.g., carcinogenicity, reproduction, or immunotoxicity studies) ongoing  
823 or completed during the reporting interval. Implications of these findings should be  
824 discussed in Sections 16 and 18 of the PBRER.

### 825 **3.11 Literature**

826 This section should summarise new and significant safety findings, either published  
827 in the peer-reviewed scientific literature or made available as unpublished  
828 manuscripts, relevant to the approved medicinal product that the MAH became aware  
829 of during the reporting interval. Literature searches for PBRERs should be wider  
830 than those for individual adverse reaction cases as they should also include studies  
831 reporting safety outcomes in groups of subjects. If relevant and applicable,  
832 information on active substances of the same class should be considered.

### 833 **3.12 Other Periodic Reports**

834 Unless otherwise specified by national or regional regulatory requirements, the MAH  
835 should prepare a single PBRER for a single active substance. However, if an MAH  
836 prepares multiple PBRERs for a single medicinal product (e.g., covering different

indications, or formulations), this section should summarise significant findings from the other periodic reports if they are not presented elsewhere within this report.

When available, based on contractual agreements, the MAH should summarise significant findings from periodic reports provided during the reporting interval by other parties (e.g., sponsors, MAHs, other contractual partners).

### **3.13 Lack of Efficacy in Controlled Clinical Trials**

Data from clinical trials indicating lack of efficacy, or lack of efficacy relative to established therapy(ies), for products intended to treat or prevent serious or life-threatening illnesses (e.g., excess cardiovascular adverse events in a trial of a new anti-platelet drug for acute coronary syndromes) could reflect a significant risk to the treated population and should be summarised in this section. When relevant to the benefit-risk evaluation, clinical trials demonstrating lack of efficacy for products not intended for treatment of life-threatening diseases in the approved indications should also be summarised.

### **3.14 Late-Breaking Information**

This section should summarise information on potentially important safety and efficacy/effectiveness findings that arise after the data lock point, but while the PBRER is in preparation. Examples include clinically significant new publications, important follow-up data, clinically relevant toxicological findings and any action that the MAH, a data monitoring committee, or a regulatory authority has taken for safety reasons. New individual case reports should not be included unless they are considered to constitute an important index case (i.e., the first instance of an important event) or an important safety signal.

The Evaluation of Risks and New Information (see Section 3.16.3 of this guideline) should also take these new data into account.

### **3.15 Overview of Signals: New, Ongoing, or Closed**

The purpose of this section is to provide an overview of signals detected, under review, and evaluated during the reporting interval.

A brief description of the method of signal detection\* used, as well as the sources screened for signals, should be provided.

A newly identified signal refers to a signal that has been identified during the reporting interval. An ongoing signal refers to a signal that was still under evaluation at the data lock point. A closed signal refers to a signal for which an evaluation was completed during the reporting interval. Signals that are both newly identified and closed during the reporting interval should be handled in this section as closed signals (i.e., signals detected during the reporting period, with evaluation completed within the reporting period).

This section should reference a tabulation of signals that are new, ongoing, and closed during the reporting interval. The tabulation should be provided as an appendix to the PBRER and conform to the template annexed to this guideline (see Appendix C). At the discretion of the MAH, this tabulation may also provide cumulative signal data by including previously closed signals, in which case the MAH should specify the starting point (date) for the cumulative data.

881 Detailed signal evaluations will not be included in this section but will instead be  
882 presented in Sections 16.2 (Signal Evaluation) and 16.3 (Evaluation of Risks and  
883 New Information) of the PBRER.

### 884 **3.16 Signal and Risk Evaluation**

#### 885 **3.16.1 Summary of Safety Concerns**

886 The purpose of this section is to provide a summary of important safety concerns at  
887 baseline, i.e., at the beginning of the reporting interval, against which new information  
888 and evaluations can be made. The following factors should be considered when  
889 determining the importance of each risk:

- 890 • medical seriousness of the risk, including the impact on individual patient;
- 891 • its frequency, predictability, preventability, and reversibility;
- 892 • potential impact on public health (frequency; size of treated population); and
- 893 • public perception of risk where it may impact public health, e.g., avoidance of  
894 vaccines.

895 The summary should present the following safety information, as of the beginning of  
896 the reporting interval of the current PBRER:

- 897 • important identified risks;\*
- 898 • important potential risks;\* and
- 899 • important missing information.\*

900 For products with an existing safety specification, this will be the same as the safety  
901 specification summary of ICH guideline E2E at the start of the reporting interval.

902 For products without an existing safety specification, this section should provide  
903 information on the important identified and potential risks associated with use of the  
904 product, based on pre- and post-approval experience. These may include, for  
905 example:

- 906 • important adverse reactions;
- 907 • interactions with other medicinal products;
- 908 • interactions with foods and other substances;
- 909 • medication errors;
- 910 • effects of occupational exposure; and
- 911 • pharmacological class effects.

912 The summary on important missing information should take into account whether  
913 there are critical gaps in knowledge for specific safety issues or populations that use  
914 the medicinal product.

#### 915 **3.16.2 Signal Evaluation**

916 Section 16.2 of the PBRER should summarize the results of evaluations of safety  
917 signals that were closed during the reporting interval. There will be two main  
918 categories:

919 1. Those signals that, following evaluation, have been categorised as a potential  
920 or identified risk, including lack of efficacy. These closed signals should be  
921 discussed in PBRER Section 16.3, Evaluation of Risks and New Information.

922 2. Those signals that, following evaluation, have been rejected as false signals  
923 based on a scientific evaluation of the currently available information. For this  
924 category of signals, a description of each signal evaluation should be included in  
925 order to provide the basis upon which the signal was rejected. This description can  
926 be included in this section of the PBRER, or in an appendix.

927 For signals that have had a completed evaluation during the interval, it is  
928 recommended that the level of detail provided in the description of the signal  
929 evaluation be proportionate to the public health importance of the concern and the  
930 extent of the available evidence, and should include the following information as  
931 appropriate:

- 932 • source or trigger of the signal;
- 933 • background relevant to the evaluation;
- 934 • methods of evaluation, including data sources, search criteria, and analytical  
935 approaches;
- 936 • results – a summary and critical analysis of the data considered in the signal  
937 evaluation;
- 938 • discussion; and
- 939 • conclusion, including proposed actions.

### 940 **3.16.3 Evaluation of Risks and New Information**

941 This section should provide a critical appraisal of all new information on all risks,  
942 which can be categorised as “important” or “other.” This includes newly detected  
943 potential and identified risks, as well as new information relevant to previously  
944 identified risks. This section should not summarise or repeat information presented  
945 in previous sections of the PBRER, but should provide an interpretation of the new  
946 information, with a view towards characterising the risk profile.

947 New information can be organised as follows:

- 948 1. new potential risks
- 949 2. new identified risks
- 950 3. new information on previously detected risks (potential or identified)
- 951 4. update on important missing information

952 Concise summaries of the evaluations of important risks should be provided. For  
953 “other” risks not classified as “important,” for which new information has emerged  
954 during the reporting interval, the level of detail should be proportional to the available  
955 evidence on the risk and its public health relevance.

956 Any new information on populations exposed or data generated to address previously  
957 missing information should be critically assessed in this section. Unresolved  
958 concerns and uncertainties should be acknowledged.

959 **3.16.4 Characterisation of Risks**

960 This section will characterise important identified and potential risks based on  
961 cumulative data (i.e., not restricted to the reporting interval), and describe important  
962 missing information.

963 Depending on the nature of the data source, the characterisation of risk may include,  
964 where applicable:

- 965 • frequency;
- 966 • numbers of cases (numerator); precision of estimate, taking into account the  
967 source of the data;
- 968 • extent of use (denominator) expressed as numbers of patients, patient-time, etc.,  
969 and precision of estimate;
- 970 • estimate of relative risk; precision of estimate;
- 971 • estimate of absolute risk; precision of estimate;
- 972 • impact on the individual patient (effects on symptoms, quality or quantity of life);
- 973 • public health impact;
- 974 • risk factors (e.g., patient factors [age, pregnancy/lactation, hepatic/renal  
975 impairment, relevant co-morbidity, disease severity, genetic polymorphism, racial  
976 and/or ethnic origin], dose);
- 977 • duration of treatment, risk period;
- 978 • preventability (i.e., predictability, ability to monitor for a “sentinel” adverse reaction  
979 or laboratory marker);
- 980 • reversibility;
- 981 • potential mechanism; and
- 982 • strength of evidence and its uncertainties, including analysis of conflicting  
983 evidence, if applicable.

984 For PBRERs for products with several indications, formulations, or routes of  
985 administration, where there may be significant differences in the identified and  
986 potential risks, it may be appropriate to present risks by indication, formulation, or  
987 route of administration. Headings that could be considered include:

- 988 • risks relating to the active substance;
- 989 • risks related to a specific formulation or route of administration (including  
990 occupational exposure);
- 991 • risks relating to a specific population;
- 992 • risks associated with non-prescription use (for compounds that are available as  
993 both prescription and non-prescription products); and
- 994 • safety concerns regarding missing information.

995 **3.16.5 Effectiveness of Risk Minimisation (if applicable)**

996 Relevant information on the effectiveness and/or limitations of specific risk  
997 minimisation activities for important identified risks that has become available during  
998 the reporting interval should be summarised in this section.

999 Insights into the effectiveness of risk minimisation activities that may be applicable  
1000 across multiple regions are of particular interest. Information may be summarised by  
1001 region, if applicable and relevant.

1002 Results of evaluations that became available during the reporting interval should be  
1003 provided in regional appendices to comply with national or regional requirements.

1004 **3.17 Benefit Evaluation**

1005 **3.17.1 Important Baseline Efficacy/Effectiveness Information**

1006 This section summarises information on the efficacy/effectiveness of the medicinal  
1007 product at baseline, i.e., as of the beginning of the reporting interval. This information  
1008 should relate to the approved indication(s) of the medicinal product, listed in the  
1009 CCDS.

1010 For medicinal products with multiple indications, populations, and/or routes of  
1011 administration, the benefit should be characterised separately by these factors.

1012 When there have been no significant changes in the benefit or risk profile of the  
1013 medicinal product in the reporting interval, the summary should be succinct,  
1014 essentially the content of the CCDS.

1015 For medicinal products where there have been significant changes in either the risk  
1016 or benefit profile, the section should include sufficient information to support an  
1017 updated characterisation of the benefit of the medicinal product in section 17.3 of the  
1018 PBRER. The type and extent of the information presented will vary by product, and  
1019 may include the following, if available and relevant:

- 1020 • a brief description of the epidemiology and natural history of the disease;
- 1021 • nature of the benefit: e.g., diagnostic, preventive, symptomatic, or disease-  
1022 modifying treatment;
- 1023 • important endpoints that support the benefit, e.g., effects on mortality, symptoms,  
1024 patient reported outcomes;
- 1025 • evidence of efficacy/effectiveness of comparators, e.g., active-controlled trials,  
1026 meta-analyses, observational studies, if applicable; and
- 1027 • when relevant to the benefit-risk evaluation, trends, patterns and/or evidence of  
1028 benefit in important subgroups, e.g., age, sex, ethnicity, disease severity, or  
1029 genetic polymorphism.

1030 **3.17.2 Newly Identified information on Efficacy/Effectiveness**

1031 Additional information on efficacy/effectiveness in approved indications that may  
1032 have become available during the reporting interval should be presented in this  
1033 section. For approved indications, new information on efficacy/effectiveness under  
1034 conditions of actual use should also be described in this section, if available. New  
1035 information about efficacy/effectiveness in uses other than the approved indication(s)

1036 should not be included, unless relevant for the benefit-risk evaluation in the approved  
1037 indication.

1038 Particular attention should be given to changes in the therapeutic environment that  
1039 could impact efficacy/effectiveness over time, e.g., vaccines, emergence of  
1040 resistance to anti-infective agents, availability of new medicinal products.

1041 The type and extent of the information presented will vary by product, and could refer  
1042 to PBRER section 17.1 if no new information became available.

### 1043 **3.17.3 Characterisation of Benefits**

1044 Section 17.3 of the PBRER provides an integration of the baseline benefit information  
1045 and any relevant new benefit information that became available during the reporting  
1046 interval for approved indications.

1047 When there are no new relevant benefit data, and no significant change in risk profile,  
1048 this section should refer to PBRER Section 17.1.

1049 When there is new positive benefit information and no significant change in the risk  
1050 profile in this reporting interval, the integration of baseline and new information in this  
1051 section should be succinct.

1052 When there is significant change to the risk profile, or new evidence that suggests  
1053 benefit is significantly less than originally demonstrated, this section should provide a  
1054 concise but critical evaluation of the strengths and limitations of the evidence on  
1055 efficacy/effectiveness, considering the following, when available:

- 1056 • a brief description of the strength of evidence of benefit, considering  
1057 comparator(s), effect size, statistical rigor, methodological strengths and  
1058 deficiencies, and consistency of findings across trials/studies;
- 1059 • new information that challenges the validity of a surrogate endpoint, if used;
- 1060 • clinical relevance of the effect size;
- 1061 • generalizability of treatment response across the indicated patient population,  
1062 e.g., information that demonstrates lack of treatment effect in a sub-population;
- 1063 • adequacy of characterization of dose-response;
- 1064 • duration of effect;
- 1065 • comparative efficacy; and
- 1066 • a determination of the extent to which efficacy findings from clinical trials are  
1067 generalizable to patient populations treated in medical practice.

### 1068 **3.18 Integrated Benefit-risk Analysis for Approved Indications**

1069 The purpose of this section is to provide an overall appraisal of the benefit and risk of  
1070 the medicinal product as used in clinical practice. This section should provide a  
1071 critical analysis and integration of the information in the previous sections with  
1072 respect to benefit and risk, and should not duplicate the benefit and risk information  
1073 presented in Sections 16.3 and 17.3.

1074 **3.18.1 Benefit-risk Context - Medical Need and Important Alternatives**

1075 This section should provide a brief description of the medical need for the medicinal  
1076 product in the approved indications, and summarise alternatives (medical, surgical, or  
1077 other; including no treatment).

1078 **3.18.2 Benefit-risk Analysis Evaluation**

1079 A benefit-risk profile is specific to an indication and population. For products  
1080 approved for more than one indication, benefit-risk profiles should be evaluated and  
1081 presented for each indication individually. If there are important differences in the  
1082 benefit-risk profiles among populations within an indication, benefit-risk evaluation  
1083 should be presented by population, if possible. The benefit-risk evaluation should be  
1084 presented in a structured manner as described below.

1085 General points regarding benefit and risk:

- 1086 • Whereas previous sections will include all important benefit and risk information,  
1087 not all benefits and risks contribute importantly to the overall benefit-risk  
1088 evaluation. Therefore, the key benefits and risks considered in the evaluation  
1089 should be specified. The key information presented in the previous benefit and  
1090 risk sections should be carried forward for integration in the benefit-risk  
1091 evaluation.
- 1092 • Consider the context of use of the medicinal product: the condition to be treated,  
1093 prevented, or diagnosed; its severity and seriousness; and the population to be  
1094 treated (relatively healthy; chronic illness).
- 1095 • With respect to benefit, consider its nature, clinical importance, duration, and  
1096 generalizability, as well as evidence of efficacy in non-responders to other  
1097 therapies and alternative treatments. Consider the effect size. If there are  
1098 individual elements of benefit, consider all (e.g., for therapies for arthritis:  
1099 reduction of symptoms and inhibition of radiographic progression of joint damage).
- 1100 • With respect to risk, consider its clinical importance, e.g., nature of toxicity,  
1101 seriousness, frequency, predictability, preventability, reversibility, impact on  
1102 patients, and whether it arose from off-label use, a new use, or misuse.
- 1103 • The strengths, weaknesses, and uncertainties of the evidence should be  
1104 considered when formulating the benefit-risk evaluation. Describe how  
1105 uncertainties in the benefits and risks impact the evaluation. For example,  
1106 uncertainty in important benefits and/or risks may reduce their contribution(s) to  
1107 the evaluation. Limitations of the assessment should be discussed.

1108 Provide a clear explanation of the methodology and reasoning used to develop the  
1109 benefit-risk evaluation:

- 1110 • The assumptions, considerations, and judgement or weighting that support the  
1111 conclusions of the benefit-risk evaluation should be clear.
- 1112 • Comment on the feasibility of expressing benefits and risks in such a way as to  
1113 facilitate their comparison.
- 1114 • If a formal quantitative assessment of benefit-risk is provided, a summary of the  
1115 methods should be included.

- 1116 • Economic considerations (e.g., cost-effectiveness) should not be considered in  
1117 the benefit-risk evaluation.

1118 When there is important new information or an ad hoc PBRER has been requested, a  
1119 detailed benefit-risk analysis based on cumulative data would be appropriate.

1120 Conversely, where little new information has become available during the reporting  
1121 interval, the primary focus of the benefit-risk evaluation might consist of an evaluation  
1122 of updated interval safety data, with the understanding that the overall benefit-risk  
1123 profile has not changed during the reporting interval.

### 1124 **3.19 Conclusions and Actions**

1125 This section should provide a conclusion about the implications of any new  
1126 information that arose during the reporting interval, in terms of the overall benefit-risk  
1127 evaluation, for each approved indication, as well as for relevant subgroups, if  
1128 appropriate.

1129 Based on the evaluation of the cumulative safety data and the benefit-risk analysis,  
1130 the MAH should assess the need for changes to the CCDS and propose changes as  
1131 appropriate.

1132 In addition, the conclusion should include preliminary proposal(s) to optimise or  
1133 further evaluate the benefit-risk balance, for further discussion with the relevant  
1134 regulatory authorities. This may include proposals for additional risk minimisation  
1135 activities.

1136 For products with an E2E (Pharmacovigilance Planning) document, the proposals  
1137 should be incorporated into the E2E pharmacovigilance plan and risk minimisation  
1138 plan.

### 1139 **3.20 Appendices to the PBRER**

1140 The PBRER should be accompanied by the following appendices, as appropriate,  
1141 numbered as follows:

- 1142 1 Reference Information;
- 1143 2 Cumulative Summary Tabulation of Serious Adverse Events from Clinical trials  
1144 and Interval/Cumulative Summary Tabulations from Marketed Experience;
- 1145 3 Tabular Summary of Safety Signals;
- 1146 4 Listing of all Post-authorisation Safety Studies (PASS);
- 1147 5 List of the Sources of Information Used to Prepare the PBRER (when desired  
1148 by the MAH).

1149 The PBRER may also be accompanied by regional appendices, as needed, to fulfil  
1150 national and regional requirements.

## 1151 **4 APPENDICES TO THIS GUIDELINE**

1152 Appendix A Glossary

1153 Appendix B Examples of Summary Tabulations

1154 Appendix C Tabular Summary of Safety Signals that were New, Ongoing, or Closed  
1155 during the Reporting Interval

1156	Appendix D List of PBRER Sections, Identified as Providing Cumulative or Interval
1157	Information, and Ability to Share Modules with Other Regulatory Documents
1158	Appendix E Examples of Possible Sources of Information That May Be Used in the
1159	Preparation of the PBRER <sup>6</sup>

---

<sup>6</sup> Examples of potential sources of information to be used in preparation of a PBRER will be included in the Step 4 guideline as general guidance. Suggestions for information sources to be included in this list should be submitted during the consultation period.

1160 **APPENDIX A – Glossary**

1161 Whenever possible the Working Group has used terms in use in other ICH guidelines, or those  
 1162 previously proposed by Council for International Organizations of Medical Sciences (CIOMS)  
 1163 working groups. Generally, the definitions of terms previously defined in ICH documents are not  
 1164 repeated in this glossary, except for those of particular importance to the PBRER.

Item	Glossary Term	Source of Definition	Definition/Commentary
1.	Closed signal	ICH guideline E2C (R2)	A signal for which an evaluation was completed during the reporting interval.
2.	Company Core Data Sheet (CCDS)	ICH guideline E2C	A document prepared by the MAH containing, in addition to safety information, material related to indications, dosing, pharmacology and other information concerning the product.
3.	Company Core Safety Information (CCSI)	ICH guideline E2C	All relevant safety information contained in the CCDS prepared by the MAH and which the MAH requires to be listed in all countries where the company markets the drug, except when the local regulatory authority specifically requires a modification. It is the reference information by which listed and unlisted are determined for the purposes of periodic reporting for marketed products, but not by which expected and unexpected are determined for expedited reporting.
4.	Completed clinical trial	ICH guideline E2F	Study for which a final clinical study report is available.
5.	Identified risk	ICH guideline E2F	<p>An untoward occurrence for which there is adequate evidence of an association with the medicinal product of interest.</p> <p>Examples of identified risks include:</p> <ul style="list-style-type: none"> <li>• an adverse reaction adequately demonstrated in non-clinical studies and confirmed by clinical data;</li> <li>• an adverse reaction observed in well designed clinical trials or epidemiological studies for which the magnitude of the difference compared with the comparator group (placebo or active substance) on a parameter of interest suggests a causal relationship;</li> </ul>

Item	Glossary Term	Source of Definition	Definition/Commentary
			<ul style="list-style-type: none"> <li>an adverse reaction suggested by a number of well documented spontaneous reports where causality is strongly supported by temporal relationship and biological plausibility, such as anaphylactic reactions or application site reactions.</li> </ul>
6.	Important identified risk, important potential risk	ICH guideline E2C(R2)	An identified risk or potential risk that could impact on the risk-benefit profile of the product or have implications for public health. What constitutes an important risk will depend upon several factors, including the impact on the individual, the seriousness of the risk, and the impact on public health. Normally, any risk that is likely to be included in the contraindications or warnings and precautions section of the product labelling should be considered important.
7.	Important missing information	ICH guideline E2C(R2)	Critical gaps in knowledge for specific safety issues or populations that use the marketed product.
8.	Investigational drug	ICH guideline E2F	The term investigational drug is used in this guideline to indicate only the experimental product under study or development. Note: This term is more specific than “investigational medicinal product”, which includes comparators and placebos.
9.	Module/modular approach	ICH guideline E2C(R2)	Sections of a report that have been written to facilitate their use in more than one regulatory document.
10.	Newly identified signal	ICH guideline E2C(R2)	A signal first identified during the reporting interval, prompting further actions for evaluation.
11.	Non-interventional clinical study	ICH guideline E2F	A study where the medicinal product(s) is (are) prescribed in the usual manner in accordance with the terms of the marketing approval. The assignment of the patient to a particular therapeutic strategy is not decided in advance by a trial protocol but falls within current practice and the prescription of the medicine is clearly separated from the decision to include the

Item	Glossary Term	Source of Definition	Definition/Commentary
			patient in the study. No additional diagnostic or monitoring procedures shall be applied to the patients and epidemiological methods shall be used for the analysis of collected data.
12.	Ongoing clinical trial	ICH guideline E2F	Trial where enrolment has begun, whether a hold is in place or analysis is complete, but for which a final clinical study report is not available.
13.	Ongoing signal	ICH guideline E2C (R2)	A signal that had been identified before the reporting interval, that was still under evaluation at the data lock point.
14.	Post-Authorisation Safety Study (PASS)	Revised 2001/83/EC amendment (Article 1[c] 15)	Any study relating to an approved medicinal product conducted with the aim of identifying, characterising, or quantifying a safety hazard, confirming the safety profile of the medicinal product, or of measuring the effectiveness of risk management measures.
15.	Potential risk	ICH guideline E2F	<p>An untoward occurrence for which there is some basis for suspicion of an association with the medicinal product of interest but where this association has not been confirmed. Examples of potential risks include:</p> <ul style="list-style-type: none"> <li>• non-clinical safety concerns that have not been observed or resolved in clinical studies;</li> <li>• adverse events observed in clinical trials or epidemiological studies for which the magnitude of the difference, compared with the comparator group (placebo or active substance, or unexposed group), on the parameter of interest raises a suspicion of, but is not large enough to suggest, a causal relationship;</li> <li>• a signal arising from a spontaneous adverse reaction reporting system;</li> <li>• an event which is known to be associated with other products of the same class or which could be expected to occur based on the properties of the</li> </ul>

Item	Glossary Term	Source of Definition	Definition/Commentary
			medicinal product.
16.	Reference Safety Information	ICH guideline E2C(R2)	Referred to as the CCSI, a subset of information contained within the MAH's central document (CCDS).
17.	Risk minimisation activities	ICH guideline E2C(R2)	Public health interventions intended to prevent or reduce the probability of the occurrence of ADRs associated with the exposure to a medicine, or to reduce their severity should they occur. The aim of a risk minimisation activity is to reduce the probability or severity of an adverse reaction. These activities may consist of routine risk minimisation (e.g., product labelling) or additional risk minimisation activities (e.g., professional or patient communications/educational materials).
18.	Safety concern	ICH guideline E2C(R2)	An important identified risk, important potential risk, or important missing information.
19.	Signal	ICH guideline E2C(R2)	Information that arises from one or multiple sources (including observations and experiments), that suggests a new potentially causal association, or a new aspect of a known association, between an intervention and an event or set of related events, either adverse or beneficial, that is judged to be of sufficient likelihood to justify further action to verify.
20.	Signal detection	ICH guideline E2C(R2)	The act of looking for and/or identifying signals using data from any source. It should be noted that a safety signal is not synonymous with a statistic of disproportionate reporting, a numerical result above a preset threshold generated from any data mining algorithm using disproportionality analysis applied to a spontaneous report database.
21.	Spontaneous Report or Spontaneous Notification	ICH guideline E2D	An unsolicited communication to a company, regulatory authority, or other organization that describes an ADR in a patient given one or more medicinal products and which does not derive from a study or any organized data collection

## 1166 APPENDIX B – Examples of Summary Tabulations

### 1167 Table 1 – Estimated Cumulative Subject Exposure from Clinical Trials

1168 Estimates of cumulative subject exposure, based upon actual exposure data from completed  
1169 clinical trials and the enrolment/randomisation schemes for ongoing trials.

Treatment	Number of subjects
medicinal product	
Comparator	
Placebo	

1170

### 1171 Table 2 – Cumulative Subject Exposure to Investigational Drug from Completed Clinical 1172 Trials by Age and Sex\*

	Number of subjects		
Age range	Male	Female	Total

1173 \* Data from completed trials as of [date]

1174

### 1175 Table 3 – Cumulative Subject Exposure to Investigational Drug from Completed Clinical 1176 Trials by Racial Group\*

Racial group	Number of subjects
Asian	
Black	
Caucasian	
Other	
Unknown	
Total	

1177 \* Data from completed studies as of [date]

1178

### 1179 Table 4 – Cumulative Exposure from Marketing Experience

indication	sex		age (years)				dose (mg/day)			formulation		region				
	male	female	2 to ≤16	>16 to 65	>65	unknown	<40	≥40	unknown	IV	oral	EU	Japan	Mexico	US/Canada	other
depression																
migraine																

1180 Table 4 includes cumulative data obtained from month/day/year through month/day/year, where  
1181 available.

1182

1183 **Table 5 – Interval Exposure from Marketing Experience**

indication	sex		age (years)				dose (mg/day)			formulation		region				
	male	female	2 to ≤16	>16 to 65	>65	unknown	<40	≥40	unknown	IV	oral	EU	Japan	Mexico	US/Canada	other
depression																
migraine																

1184

1185 Table 5 includes interval data obtained from month/day/year through month/day/year, where  
1186 available.

1187 **Table 6 – Cumulative Tabulations of Serious Adverse Events from Clinical Trials**

<u>System Organ Class</u> Preferred Term	[medicinal product]	Blinded	Active comparator	Placebo
<u>Investigations</u>	n	n	n	n
Alanine aminotransferase increased	n	n	n	n
Aspartate aminotransferase increased	n	n	n	n
<u>Nervous System Disorders</u>	n	n	n	n
Syncope	n	n	n	n
Headache	n	n	n	n

1188

1189 **Table 7 - Numbers of Adverse Drug Reactions by Term from Post-marketing Sources\***

	Spontaneous, including regulatory authority and literature				Non-interventional post-marketing study				Total
	serious		non-serious		serious		non-serious**		cumulative, all
	interval	cumulative	interval	cumulative	interval	cumulative	interval	cumulative	
SOC 1									
MedDRA PT									
MedDRA PT									
MedDRA PT									
SOC 2									
MedDRA PT									
MedDRA PT									
MedDRA PT									
MedDRA PT									

1190

1191 \*Non-interventional studies and spontaneous ICSRs (i.e., reports from healthcare professionals,  
1192 consumers, regulatory authorities, and scientific literature)

1193 \*\* Non-serious ADRs from non-interventional Post-Authorisation Safety Studies (PASS) only  
1194 should be tabulated here. See Glossary.

## APPENDIX C – Tabular Summary of Safety Signals that were New, Ongoing, or Closed during the Reporting Interval

**Product Name:** \_\_\_\_\_

**Reporting Interval:** DD-MMM-YYYY to DD-MMM-YYYY

Signal term	Date detected	Status (new, ongoing, or closed)	Date Closed (for closed signals)	Source or trigger of signal	Reason summary	Method of signal evaluation	Outcome, if closed
stroke	month/year	new	month/year	spontaneous, animal	brief summary of key data and rationale for further evaluation	review cases; epidemiological studies	

### Explanatory notes

- Signal term

A brief descriptive name of a medical concept for the signal. This may evolve and be refined as the signal is evaluated. The concept and scope may or may not be limited to specific MedDRA term(s), depending on the source of signal. Where applicable, the table should refer to the specific MedDRA terms (e.g., PTs, HLTs, SOCs, etc.) or Standardised MedDRA Queries (SMQs) that were reviewed.

- Date detected (month/year)

Month and year when the signal was detected (that is, when a determination was made to conduct further evaluation).

- Status

New: Signal identified during the reporting interval.

Ongoing: Signal under evaluation at the data lock point (the end of the reporting interval). Provide anticipated completion date, if known.

Closed: Signal for which evaluation was completed during the reporting interval.

Note: A signal may be “new” and “closed” if an evaluation of a newly identified signal was completed within the reporting interval. The signal should be identified as “new and closed” in the tabulation, but handled as a closed signal for the purposes of the evaluation (see Section 3.16.2 of this guideline).

- Date closed (month/year)

- 1222 Month and year when the signal evaluation was completed.
- 1223 • Source or trigger of signal
- 1224 Data or information source from which a signal arose. Examples include, but may not be
- 1225 limited to, spontaneous adverse event reports, clinical trial data, scientific literature, and non-
- 1226 clinical study results.
- 1227 • Reason summary
- 1228 A brief summary of key data and rationale for further evaluation.
- 1229 • Outcome, if closed
- 1230 State whether or not a specific action is required. Refer to the description of signal evaluation
- 1231 (to be described in the Section 3.16.2 of this guideline, Signal Evaluation) for further detail.
- 1232 Leave blank for signals under evaluation at the data lock point.

1233

1234 **APPENDIX D – List of PBRER Sections, Identified as Providing Cumulative or Interval**

1235 **Information, and Ability to Share Modules with Other Regulatory Documents**

1236

		Cumulative	Interval	Potential shared module with
1	Introduction	X		
2	Worldwide Marketing Approval Status	X		E2F
3	Actions Taken in the Reporting Interval for Safety Reasons		X	Parts may be common to E2E and E2F
4	Changes to Reference Safety Information		X	
5	Estimated Exposure and Use Patterns			
5.1	Cumulative Subject Exposure in Clinical Trials	X		E2E and E2F
5.2	Cumulative and Interval Patient Exposure from Marketing Experience	X	X	E2E and E2F (cumulative only)
6	Data in Summary Tabulations			
6.1	Reference Information	Not applicable	Not applicable	
6.2	Cumulative Summary Tabulations of Serious Adverse Events from Clinical Trials	X		E2F
6.3	Cumulative and Interval Summary Tabulations from Post-marketing Data Sources	X	X	
7	Summaries of Significant Findings from Clinical Trials during the Reporting Period			

7.1	Completed Clinical Trials		X	E2F
7.2	Ongoing Clinical Trials		X	E2F
7.3	Long-term Follow-up		X	E2F
7.4	Other Therapeutic Use of Medicinal Product		X	E2F
7.5	New Safety Data Related to Combination Therapies		X	E2F
8	Findings from Non-interventional Studies		X	E2F
9	Information from Other Clinical Trials and Sources		X	E2F
10	Non-clinical Data		X	E2F
11	Literature		X	E2F
12	Other Periodic Reports		X	
13	Lack of Efficacy in Controlled Clinical Trials		X	E2F
14	Late-Breaking Information		X	E2F, if reports cover same period and submitted at same time
15	Overview of Signals: New, Ongoing, or Closed	X§	X	
16	Signal and Risk Evaluation			
16.1	Summary of Safety Concerns	X		
16.2	Signal Evaluation		X	
16.3	Evaluation of Risks and New Information	X	X	
16.4	Characterisation of Risks	X		
16.5	Effectiveness of Risk Minimisation (if applicable)		X	
17	Benefit Evaluation			
17.1	Important Baseline Efficacy/Effectiveness Information	X		
17.2	Newly Identified information on Efficacy/Effectiveness		X	
17.3	Characterisation of Benefits	X	X	
18	Integrated Benefit-risk Analysis for Approved Indications			
18.1	Benefit-risk Context - Medical Need and Important Alternatives	X		
18.2	Benefit-risk Analysis Evaluation	X		
19	Conclusions and Actions	X	X	E2F
